Inventory Module Summary

The Inventory Module allows for the creation and management of multiple, separate inventories that can be used to track quantity changes. To do so, the Inventory Module is dependent on customized, underlying databases: a locations database, a stock inventory database, and a (optional) unique items database. The three (or more) underlying databases are created in the Database Module and integrated with the inventory it is associated with in the Inventory Module.

> The User Manual for the Inventory Module is updated through Version 12.0.
