Customize Trigger Settings Based on Pre-Existing Tasks

It is possible for a task’s trigger to be based on the schedule of another pre-existing task within the same asset tree.

> It is not possible to follow or copy another task’s schedule if the original task has an “on expiry” trigger.

Trigger Behavior: Follow Another Task’s Schedule

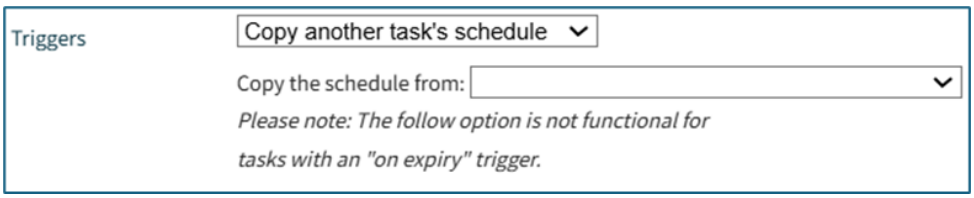

When a trigger’s behavior is set to “Follow another task’s schedule,” the original task and new task are now linked.

If the trigger for the task selected is altered, the trigger for the task following it will be altered as well.

Trigger Behavior: Copy Another Task’s Schedule

When a trigger’s behavior is set to “Copy another task’s schedule,” the two tasks function independently of each other.

If the schedule for the copied trigger is altered, it has no impact on the task schedule just created. This option allows the user to efficiently duplicate task schedules with ease.
