Remotes Module

The Remotes Module is a purpose-specific module that allows for establishment of a top-down association between a parent domain and one or many subdomains. This module enables a parent domain to maintain their own private information and userbase, while still having oversight of and ability to share content with subdomains. The Remotes Module enables distribution of designated items from the Actions, Documents, and People Modules to subdomains linked to the parent domain. This module can also grant login access to linked subdomains for Accounts on the parent domain, in order to facilitate compliance reviews.

The Remotes Module serves Fortune 500 companies that manage facilities and workflows on a global scale, organizations with need for a home office / local site setup, and franchiser / franchisee location structures (among others), by enabling the flow of information required to support organizational needs regardless of their size and complexity.
